

Broad Run: four independent sources, one basin

The basin carrying 72.5% of Prince William County's data centers

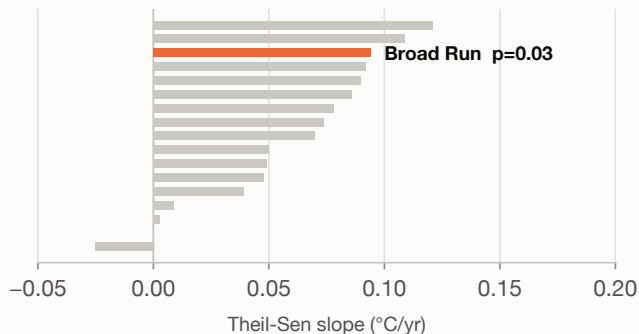

a 72.5% of the fleet on 19.9% of the land

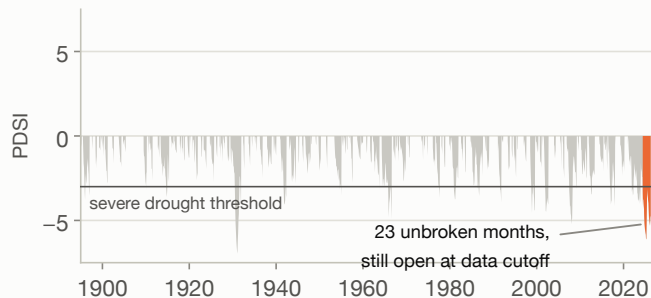

b the denominator predates the numerator

c 17 stream stations; 15 warming, 1 cooling

d worst drought in the 132-year record

Concentration is the county's own watershed layer crossed with the building attribution. The flow denominator comes from a gage decommissioned in 1986, which never observed any part of the drought now underway. Of 17 stream stations in the Prince William / Occoquan group, 15 have positive temperature trends, 1 is exactly zero and 1 negative (sign test on the 16 non-ties: $p = 0.0005$); Broad Run 1ABRB002.15 is the only one individually significant at $p < 0.05$. Statewide only 49 of 413 stations are significant — but 47 of those 49 are warming and 2 cooling. The PDSI series is the observed NOAA/NCEI county record, not a projection.
